BTO HR owner checklist

For Keyan FEILI. Use with BTO_HR_Team_Setup.pdf. Pilot on a colleague's own account.

1. Release and permissions

Confirm main contains the tested release and plugin.json names bto-hr. Keep the existing repository URL and bto-cv-marketplace registration. Verify all three packaged skills: bto-cv, score and trello. Provide repository access if needed; provide the BTO candidates sharing link with edit access and Trello board access.

2. Installation and migration

Have a colleague drop the team PDF into a local Codex chat and send its setup message. Confirm enabled version matches the refreshed manifest. Migrate bto-cv only after BTO HR works; preserve private Excel configuration first. Archive standalone Score/Talent Pool duplicates outside discovery. In a fresh chat, confirm only the three repository HR skills appear, alongside any unrelated installed tools.

3. Verify each capability separately

Updater: installed hooks/update.py --force --check returns current or updated. Verify trusted SessionStart execution separately; direct execution does not prove hook lifecycle success.

CV: convert the fictional sample; inspect all rendered pages, editable content, banner, native square bullets and 1.5-line spacing on Main responsibilities labels. Disclose missing fonts or rendering limits.

Score: use fictional local assessment data to verify independent JD scores, language flags and the 0-5 employer bonus. Confirm BTO candidates edit access and private destination setup. Test real writes only with an authorised candidate batch; verify the >=80 boundary, correct existing sheet, duplicate handling, blanks and preservation of colleague columns. No qualifying candidate means no workbook change.

Trello: verify authenticated board/list/label access without writing sample cards. For the first authorised batch, verify title, profile fields, list and seniority. Preserve existing content.

Acceptance

Record pass, pending or blocked for each item. Full setup is verified only when its required checks pass on the colleague's machine.

Updates and recovery

Keep the shared package current without losing private configuration.

4. Maintain the release

Edit the repository, not installed caches. Preserve CV layout and factual wording rules. Bump plugin.json for package changes and rebuild these guides. Run both suites and the CV input check:

```
python -m unittest discover -s tests -v
```

```
python -m unittest discover -s skills/score/tests -v
```

```
python skills/bto-cv/scripts/build_docx.py skills/bto-cv/references/input-example.json --check
```

```
python docs/build_guides.py
```

Render and inspect every onboarding page before publishing. Never commit private workbook configuration, candidate CVs, rankings or reconciliation data.

5. Refresh an installation

After an update, confirm Score still opens BTO candidates. If asked for the workbook again, provide its sharing link.

```
codex plugin marketplace upgrade bto-cv-marketplace
```

```
codex plugin add bto-hr@bto-cv-marketplace --json
```

```
codex plugin list --marketplace bto-cv-marketplace --json
```

Compare the enabled installed version with the refreshed manifest. Start a new chat; changed hooks may need renewed review. SessionStart checks occur at most daily; failures retry at a later startup/resume after at least one hour. This is not a background timer.

6. Handle failures without discarding working setup

Check Git access, Python, Codex CLI and supported sign-in flows. Do not delete credentials or bypass hook trust. CV conversion can use the last verified template/generator pair offline. Report Excel/Trello access failures separately. Preserve completed local rankings when sync is blocked.
